

With over 30 years of in-house polymerisation experience, Thomas Swan is ideally placed to assist you with your polymerisation needs.

We can provide a broad range of technologies and solutions.

Our state-of-the-art facilities are designed to support a wide range of polymerisation technologies, from traditional polyamide and polyester products to complex emulsion polymerisation processes with capacities up to 1000mt per annum. Recent investments include a GLMS installation which is capable of sequentially feeding several monomers to tailor individual polymer products based on customer requirements. Safe and efficient scale up of polymerisations is a strength at Thomas Swan. This is supported by onsite state-of-the-art thermal calorimetric screening tools, including TSu, PhiTec and Simular equipment. An experienced multi-disciplinary team of engineers, production and technical personnel, ensures that safety is paramount during scale up and manufacture. This team identifies a robust process safety envelope for all of our manufacturing processes.
